

Verizon Wireless Switch

PROJECT OBJECTIVE

The project from Verizon Wireless was to furnish and install 30 ton computer room air conditioning unit with humidification for the main switch.

Grilles and Boxes

PROJECT OVERVIEW

This project required many aspects of coordination. The space in the ceiling was extremely congested which required many different safety components. Mared had to consider how to approach the switch gears and computer equipment rack that already existed in the building.

PROJECT RESULTS

After completing the project Mared was asked to add additional supply boxes and grilles and also balance existing rooftop units.

Mared completed the Verizon Wireless Switch project in October, 2006. We quoted the project for \$119,000.
